TITLE: Determination of the natural vibration frequencies of liquids in complex pipelines

SOURCE: AN SSSR. Izvestiya. Mekhanika zhidkosti i gaze, no. 2, 1966, 133-136

TOPIC TAGS: pipeline, liquid flow

ABSTRACT: The article considers a complex hydraulic system consisting of n individual pipelines, with a homogeneous liquid; the pipelines have a constant elastic characteristic over their length. The wave type process in the system will then be described by the equations:

$$\frac{\partial^2 G_1}{\partial \tau^2} + 2a \frac{\partial G_1}{\partial \tau} = c_1^2 \frac{\partial^2 G_1}{\partial x_1^2}, \dots, \frac{\partial^2 G_n}{\partial \tau^2} + 2a \frac{\partial G_n}{\partial \tau} = c_n^2 \frac{\partial^2 G_n}{\partial x_n^2} \quad (1.1)$$

Here G is the mass flow rate per second of the liquid; a is the decrement of the damping of the wave type process; c is the propagation

Card 1/2

L 29867-66

ACC NR: AP6013213

velocity of the elastic wave in the liquid filling the pipeline;  $x$  is the coordinate along the axis of the pipeline, calculated from its beginning;  $\tau$  is the time. After transformation, the general solution can be brought into the form

$$G_1(x_1, \tau) = \exp(-\sigma\tau) \sum_{k=1}^{\infty} A_{1k} \sin\left(\frac{\omega_k x_1}{c_1} + \varphi_{1k}\right) \sin(\sqrt{\omega_k^2 - \sigma^2} \tau + \psi_k) \quad (1.3)$$

$$G_n(x_n, \tau) = \exp(-\sigma\tau) \sum_{k=1}^{\infty} A_{nk} \sin\left(\frac{\omega_k x_n}{c_n} + \varphi_{nk}\right) \sin(\sqrt{\omega_k^2 - \sigma^2} \tau + \psi_k)$$

where  $A_{1k}$ ,  $\varphi_{1k}$ , and  $\psi_k$  are arbitrary constants determined by the initial and boundary conditions;  $\omega_k$  are the natural values. The article first treats the problem of determining the natural vibration frequency of a liquid in pipelines connected in series, and then takes up the question of the same determination in branched pipelines. Orig. art. has: 28 formulas.

Title : On the Problem of Histogenesis of Isles of Langerhans in An Adult.

Orig Pub: Fiziol. norm. si patol., 1956, 3, No 3, 369-377

Abstract: A study was conducted of proliferation of isles of Langerhans (IL) in hypoglycemic syndrome at the expense of exocrine tissues. Hypertrophy of IL is noted (an increase in diameter up to 350-400 $\mu$ , instead of the normal 50-200 $\mu$ ), increase in numbers of IL (8-12 per visual field), and conversion of exocrine into endocrine tissue. At the same time hypertrophy of centro-acinose cells and cells forming intralobular excretory ducts are found. Histo-

Abs Jour: Ref Zhur - Biol., No 6, 1958, 23758

Abstract: chemically these cells acquire properties of typical IL elements (staining of B-cells by azan and by the Gomori method). In typically hypertrophied and newly formed IL the McManus-Hotchkiss reaction is negative. IL occurred at a stage of heightened secretory activity and were composed almost exclusively of large-scale B-cells. Hypertrophy of the gland's nerve ganglia is noted. These changes represent the morphological substrate of increased insulin production, which is characteristic of hypoglycemic syndrome. The new formation of endocrine tissue is regarded by the authors as a regenerative compensatory hypertrophy. The plasticity of IL histogenetic ability is emphasized, of centroacinos cells and epithelium of excretory ducts in the postembryonal life period.

823. MORPHOLOGICAL AND FUNCTIONAL CHANGES OF THE TERMINAL NERVES OF THE UTERUS DURING OESTRUS AND IN PREGNANCY (Russian text) - Velikan-Gabriliescu E. and Bordeianu A. - ARKH. PATOL. 1958, 20/2 (55-68) illus. 8

These studies were undertaken in 56 rabbits, 10 rats and 6 dogs. Intravital methylene blue staining was carried out during different oestrus stages and during pregnancy. During a period of weak hormone stimulation the nervous network of the uterus is only slightly developed: it consists of single nerve fibres with only few anastomoses. In this stage no terminal apparatus could be demonstrated and no innervation of the mucosa could be observed. The histological picture is appreciably altered during oestrogen-progesterone stimulation: there is an abundant nervous network with terminal structures, the mucosa is amply innervated, the nerve fibres are granular with accumulations of protoplasm. At the beginning of pregnancy these modifications became even more pronounced. As the pregnancy progresses the demonstration of the nervous network becomes increasingly difficult, whereas the interstitial cells are clearly visible. The same innervation picture as seen during hormonal stimulation can also be evoked by artificial oestrone administration; larger quantities lead to diffuse staining of the tissue. These findings appear to prove the occurrence of cyclic alterations of the structure of the nervous apparatus of the uterus.

TITLE: I. The Electric Conductivity of the Molten Sulfides of Tin, Antimony, Bismuth, and Nickel (I. Elektroprovodnost' rasplavlennykh sul'fidov olova, sur'my, vismuta i nikelya)

PERIODICAL: Zhurnal Neorganicheskoy Khimii, 1958, Vol 3, Nr 5, pp 1075-1078 (USSR)

ABSTRACT: In the present paper, the specific conductivity of the melts of SnS, SbS<sub>3</sub>, Bi<sub>2</sub>S<sub>3</sub>, and NiS is investigated. The sulfides are produced by precipitation from an aqueous solution of the purest chlorides of these metals by H<sub>2</sub>S. The results show that the molten sulfides exhibit a high electric conductivity, similar to the electric conductivity of some metals. The electric conductivity of Bi<sub>2</sub>S<sub>3</sub> and NiS is much higher than that of the other melts. Positive temperature coefficients have been found for the electric conductivity of Sb<sub>2</sub>S<sub>3</sub> and SnS, and negative temperature coefficients for the electric conductivity of Bi<sub>2</sub>S<sub>3</sub> and NiS. The dependence of the specific conductivity on temperature in the molten sulfides is given by Frankel's equation

Card 1/2

I. The Electric Conductivity of the Molten Sulfides of Tin, 78-3-5-3/39  
Antimony, Bismuth, and Nickel

$x = A \cdot e^{-U/kT}$ . It is supposed here, that in the melts of SnS and  $Sb_2S_3$  electric conductivity is predominant, while in  $Bi_2S_3$  and NiS prevails electronic conductivity. The character of the electric conductivity of the examined molten sulfides changes in the same way as the chemical properties of the corresponding oxides. The electric conductivity increases in the following succession:  $Sb_2S_3$ -SnS- $Bi_2S_3$ -NiS. In the same succession the value of the corresponding temperature coefficients decreases. There are 2 figures, 3 tables, and 10 references, 3 of which are Soviet.

AUTHORS: Delimarskiy, Yu. K. and Velikanov, A. I.  
TITLE: Electrolytic Separation of Antimony From Fused Sulfide  
PERIODICAL: Ukrainskiy khimicheskiy zhurnal, 1960, Vol. 26, No. 2,  
pp. 168-173

TEXT: The authors determined the voltages of the decomposition of fused antimony trisulfide and the melt (15%  $\text{Na}_2\text{S}$  - 85%  $\text{Sb}_2\text{S}_3$ ). The experimental data were compared with the thermodynamically calculated values. The decomposition potential of  $\text{Sb}_2\text{S}_3$  was calculated at  $800^\circ\text{C}$  by using the known thermodynamical interrelations. It amounted to 0.42V which is in satisfactory agreement with the experimental data. The authors found that the current yield is temperature-dependent. The highest current yield (63.5%) was obtained at a temperature of  $800-860^\circ\text{C}$ . The authors also studied the dependence of the current yield on the cathodic current density. The following are the optimum conditions of electrolysis in nitrogen atmosphere:

Card 1/3

AUTHOR: Velikanov, A. A.

TITLE: Electrical Conductivity of Molten Silver Sulfide

PERIODICAL: Ukrainskiy khimicheskiy zhurnal, 1960, Vol. 26, No. 3,  
pp. 319 - 323

TEXT: The present paper reports on an investigation of electrical conductivity of molten silver sulfide to clarify the influence exercised by its composition on the electrical conductivity of its melt. The author used a previously (Ref. 4) described method based on argon atmosphere and graphite electrodes, one of which also served as a vessel to hold the sulfide melt. The electrodes were separated by a quartz wall equipped with a capillary tube. The resistance of the melt in the capillary tube was measured. The author describes the method of producing the silver sulfide used. He also succeeded in measuring the specific electrical conductivity below the freezing point of  $Ag_2S$ . Table 1 shows this conductivity for compositions of varying sulfur content at different

Card 1/3

Electrical Conductivity of Molten Silver Sulfide

S/073/6C/026/003/002/004  
B016/B054

temperatures. Hence, it appears that conductivity decreases with rising temperature. This decrease is considerable in the transition of solid silver sulfide to the molten state. Further, the author calculated the absolute and relative temperature coefficients of the electrical conductivity of the melt and solid silver sulfide. The values of the temperature coefficients indicated in Table 2 reveal the typically metallic character of the conductivity of both the solid and the molten silver sulfide, which is also suggested by the specific electrical conductivity. Finally, the author prepared three samples (Table 3) of silver sulfide with different silver and sulfur contents. A moderately strong argon flow was blown through the melt at 1000°C, which accelerated the mixing of the melt and the dissolution of silver in the sulfide. The melt was allowed to stand for 15 min, then cooled quickly, and the sulfide layer separated from the metal layer. The author did not succeed in producing a silver sulfide which contained more sulfur in the molten state than would correspond to the stoichiometric ratio. A Fig. (p.322) shows the electrical conductivity of the samples as a function of temperature. The conductivity of molten silver sulfide depends, to a great extent, on the composition of the product (on the Ag:S ratio). It

Card 2/3

Electrical Conductivity of Molten Silver  
Sulfide

S/073/60/026/003/002/004  
B016/B054

increases with rising metal content in the melt. The temperature coefficient rises sharply, i.e., the metallic character of the electrical conductivity becomes stronger. The author explains this by the fact that the conductivity of the melts of Ag-S systems bases on metal-metal bonds whose quantity increases with rising silver content. There are 1 figure, 3 tables, and 6 references: 2 Soviet and 2 German.

SOV/118-59-2-1/26

AUTHOR: Velikanov, A.S., Engineer

TITLE: Sovnarkhozes and the Automation of Industrial Processes (Sovnarkhozy i avtomatizatsiya proizvodstvennykh protsessov)

PERIODICAL: Mekhanizatsiya i avtomatizatsiya proizvodstva, 1959, Nr 2, pp 3-5 (USSR)

ABSTRACT: In 1965, the total volume of Soviet industrial production is to be twice that of 1958. A considerable part of the production increase will result from the basic reconstruction of existing enterprises, from new equipment and the introduction of new technological processes based on complex mechanization and automation. The leading role in realizing the technical progress belongs to the various Sovet narodnogo khozyastva (Council of National Economy). Until now all designing work has been carried out by a few institutions situated in the center of the country, very often thousands of km away from the industrial

Card 1/4

SOV/118-59-2-1/26

Sovnarkhozes and the Automation of Industrial Processes

enterprises; e.g. the Institut "Stal'proyekt" ("Stal'proyekt" Institute) in Moscow designed automatic equipment on the correlation "mazut-air" for the "Amurstal'" plant of the Khabarovskiy (Khabarovsk) sovnarkhoz, without taking into account the existing equipment. The design proved to be deficient. Similar cases happened at other enterprises. Following the general economic decentralization line, the sovnarkhozes have now started to establish local projects, scientific research and assembly institutions to solve highly important problems of technical progress themselves. The Sverdlovskiy (Sverdlovsk) sovnarkhoz is planning to set up 2 complex automation and 11 complex mechanization enterprises, a certain number of automated and mechanized plants; automatic, semiautomatic and mechanized production lines; automatic and semiautomatic machines, etc. The Gor'kovskiy (Gor'kiy) sovnarkhoz has established a technological projects and scientific research institute for

Card 2/4

SOV/118-59-2-1/26

Sovnarkhozes and the Automation of Industrial Processes

the development of new technological processes, and for the construction and adjustment of new equipment for the mechanization and automation of enterprises. Analogous organizations have been established by the Krasnodarskiy (Krasnodar), Chuvashskiy (Chuvash), Krasnoyarskiy (Krasnoyarsk), Smolenskiy (Smolensk) and Magadanskiy (Magadan) sovnarkhozes. The author suggests that the technical supervision be carried out by the Tsentral'nyy nauchno-issledovatel'skiy institut kompleksnoy avtomatizatsii Gosplana SSSR (Central Scientific Research Institute of Complex Mechanization of the USSR Gosplan) and the Gosudarstvennyy nauchno-tekhnicheskiy komitet Soveta Ministrov SSSR (State Scientific Engineering Committee of the USSR Council of Ministers). Projects institutions should be established above all in Ulan-Ude, Kursk, Khabarovsk, Ufa, Stalino, Stavropol', Kemerovo, Lipetsk, Kuybyshev, Rostov, Belgorod, Lugansk, Zaporozh'ye, Tyumen', Omsk, Yaroslavl',

Card 3/4

Sovnarkhozes and the Automation of Industrial Processes

SOV/118-59-2-1/26

Penza, Yuzhno-Sakhalinsk, etc. The author criticizes the inefficient assembly work of the following trusts, which are installing control and measuring devices and automation means: "Teplokontrol'", "Neftekhimmontazh", "Promstroyavtomatika" and of 2 provincial enterprises - the "Yuzhmetallurgavtomatika" and the "Uralmetallurgavtomatika" (both departments of the "Energochermet" Trust). The following plants are blamed for not having introduced automation and mechanization: "Azovstal'", Kramatorskiy stankostroitel'nyy zavod (the Kramatorsk Machine Construction Plant), Shadrinskiy avtoagregatnyy zavod (the Shadrinsk Autocar Outfit Plant) of the Kurganskiy (Kurgansk) sovnarkhoz. Many enterprises of the Krasnodarskiy (Krasnodar) sovnarkhoz are still using labor-consuming, non-effective manual labor, particularly in loading and unloading operations.

TITLE: Effect of carbon content on the properties of high-carbon low-alloy steels

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 9, 1965, 25-27

TOPIC TAGS: carbon steel, low alloy steel, impact strength, hardness, fatigue  
 strength, cyclic load

ABSTRACT: The authors present the results of an investigation of the properties of low-alloy chrome-vanadium and manganese steels as a function of their C content (0.38 to 0.70%). Specimens with fixed hardness ( $H_B$  350 and 450) were obtained by varying the tempering temperature. In the presence of identical hardness, strength also proved to be identical whatever the C content within the range investigated, but the yield point differed. As the C content increases in specimens of low-alloy steels endowed with Brinell hardness of 450 the ratio of yield point to strength increases, whereas in specimens with  $H_B = 350$  this ratio

Card 1/2

L 00026-66

ACCESSION NR: AP5022577

decreases. The plasticity and impact strength of steels with  $H_B = 350$  and 450 decrease with increasing C content. On the other hand, increasing the C content of these steels (to 0.60-0.65%) favorably affects the increase in fatigue limit. The optimal C content of machine steels depends on the character of loading. If the loading is cyclic, C content should be increased to 0.60-0.65%. In products performing under impact, on the other hand, the C content should be lower (optimally 0.6% C). Orig. art. has: 5 figures, 1 table.

Orig Pub : Tr. Yaroslavsk. s. 1-1 kh. in-to 1957, 4, 169-180

Abstract : The following basic soil types are located in the territory of Yaroslavskaya Oblast': sod-podzolic, podzolic, gray forest, sod-podzolic gleyey, peat-podzolic gleyey, dark-colored marshy, dark-colored peat, meadow-alluvial and solonchak soils. Slightly-loamy and averagely-loamy soil varieties predominate. Spills of the watersheds are characterized by considerable rock formations. A majority of the soils of arable utilities is undercultivated

30-1-27/39

TITLE: Fourth International Conference on Automobile Engineering  
(4-ya mezhdunarodnaya konferentsiya po avtomobil'noy  
tekhnike)

PERIODICAL: Vestnik AN SSSR, 1958, Vol. 28, Nr 1, pp. 109-110 (USSR)

ABSTRACT: This conference was arranged by the Technical Chamber of  
the German Democratic Republic at the Automobile Institute  
of the Technical University in Dresden from June 4 to 6,  
1957. Delegations of scientists and engineers of the  
following countries took part: The German Democratic Re-  
public, Hungary, China, Poland, the USSR, the CSR and  
individual specialists from the German Democratic Republic  
and from France. The following reports were delivered and  
discussed: general problems of automobile building and  
-engineering, the development of the theory as well as of  
the construction of piston engines, the rolling of an  
elastic wheel, and the use of plastics for automobile  
bodies. Much interest was also shown in engines with air  
cooling. Tsaluda (Prague) reported on the "high-pressure  
blower" of Diesel engines, which can increase the power of

Card 1/2

an ordinary engine by 18%. Lange (Zittau) reported on the series Production of carburettor- and Diesel engines for the trucks of the "Robur" works. Biedermann (Dresden) reported on the results of the application of an new apparatus for the investigation of fuel injection. Hintze (Magdeburg) submitted a proposal for the thermodynamic analysis of indicator diagrams. Reichelt (Zwickau) reported on the series production of bodies made of plastics, 1500 such automobiles being produced monthly. D. P. Velikanov (USSR) reported on the development of automobile production in the USSR as well as on their constructional characteristics, as required by ways and climate.
